

Title

In the front page, put your name, specify also the supervisors and where you did your internship

July 14, 2025

Abstract

This document is intended to be a guide to structure your report. **Important:** this structure may not be suitable for all domains, so do not try at all costs to fit in it: what is important is that these elements (when applicable) are present in the report and that the latter is well-structured and clear. You may have sections specific to your domain.

1 Introduction

The context

- Describe the context so that a non-expert can understand it. Be careful to explain with simple words and examples the main concepts and tools you need. Example: you need to use a LLM, say that this is a usually very large neural network model trained with self-supervised machine learning (meaning that it does not need annotated examples) on a vast amount of text, designed for natural language processing tasks, such as text generation (construction of computer systems that can produce understandable texts in English or other human languages from some underlying non-linguistic representation of information).
- Introduce the problem you are interested in, its formulation and how it arises from the context
- Describe the challenges and limitations associated to the problem
- You can also specify the practical context of the internship: if you were in a company, if you had access to specific data, collaborated with some other people from the applications...

State-of-the-art Describe the state of the art and why it is not satisfactory

My contribution Clearly describe the aim of the internship and how you improved on the state-of-the-art. If there is no improvement with respect of the state-of-the-art it is not a problem, describe what you have learned about the problem and propose a critical literature review.

Notations If useful, report here some notations useful for the following.

Suggestion : Don't hesitate to include figures and schemes if useful to illustrate a concept. It is usually a good idea to prepare a preliminary version of the slides before sending the final version of the report: usually you spend effort to prepare figures for the presentation, which could be used to enrich the report also. Moreover, often the effort that one makes for arranging the content to explain it in an oral presentation can be helpful to improve clarity and flow of information in the written report.

2 Background

You can include a technical section about pre-requisites necessary to understand the state of the art and what you have done, but be careful not to be too technical, it must remain pedagogical.

3 My internship

Describe what you have done in your internship, organizing the content as suitable to what you need to present: this depends on your internship. Clearly structure this part with more sections and subsections

4 Experiments (if applicable)

- Clearly present the experimental setting so that experiments can be reproduced. Use tables and plots but reference them in the text and explain them and what are the conclusions that we can infer from them.
- Compare yourself with the literature if pertinent
- Put a link to your clean and well-commented code if possible
- Put small examples of code/pseudocode/programs if useful for the understanding

5 Conclusions

Resume your contribution and put the results in perspective with respect to the state of the art and your initial goal in the internship.

6 References

Include references with bibtex, the list should be long enough to be representative of your field of research

Appendix

Put here the extra material: technical proofs that are not crucial for the main results, link to code or examples of code/pseudocode, link to articles you may have written, link to data....
